Green Team – Mission SEAFARER

Our Destination

Saturn and its Moons

But why?

Our Destination

Saturn and its Moons

Planet Formation

History of Solar System

(Potential) Ocean Worlds

Early Earth Archetype

Motivation

7

1997-2017

Heritage

- Characterized Saturn's atmosphere
- Discovered Enceladus' plume
 - CHNOPS & organics
- Enceladus mapped
- Huygens landed on Titan
 - Atmosphere
 - Lakes
- Dragonfly to land on Titan
 - Dry equatorial land
 - Habitability

Open Questions

- Elemental composition poorly known
- Cassini scratched the surface
→ SEAFARER designed for habitability
- Low resolution → higher resolution for future landers
- Large scale circulations to be addressed
- Complement Dragonfly
 - Lakes (properties remain unknown after Cassini)
 - Habitability

2028-

Green Team – Mission SEAFARER

*Report of the Expert Committee for the Large-class mission
in ESA's Voyage 2050 plan covering the science theme
"Moons of the Giant Planets"*

Copyright: ESA/Science Office

*Expert Committee Report for the Large-class
Mission "Moons of the Giant planets":*

- 1) The issue of **habitability** of ocean worlds and the interaction between the surface and the interior
- 2) The issue of habitability of **oceans worlds** and the interaction with the external environments
- 3) The identification of **prebiotic chemistry** and the search for **biosignatures** on ocean worlds.

Most interesting target: Enceladus

2nd place: Titan

Lander and Orbiter

Green Team – Mission SEAFARER

Our Destination

Saturn and its Moons

“SEAFARER shall study and characterise the diversity of habitats in the Saturnian systems”

Science Objectives

10

Objective 1: How and where did **Saturn** form?

Objective 2: What is the nature and diversity of the **potential habitats**?

Objective 3: What is the peculiar nature of the **Titan climate** variability?

Green Team – Mission SEAFARER

Science Traceability Matrix

SEAFARER: A mission to study Habitability in the Saturnian System

Scientific Goals	Scientific Question	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
1. Understand Saturn's formation and orbital evolution	1.1. What is Saturn's formation history and composition for the present day Solar System architecture?	1.1.1. In situ isotopic ratios of noble gas and elements (H, He, Ne, Ar, Kr, Xe, C, N, O, and S) in Saturn's atmosphere. 1.1.2. In situ mixing ratios of the species CO, CH ₄ , PH ₄ , NH ₃ in Saturn's atmosphere.	Abundance at a resolution of from 1 to > 100 nm, time resolution > 1000 M/ΔM. The Tinsdale laser spectrometer shall have a resolving power of ~10 ⁴ /Δλ at least.	Data retrieval from 1 orbit to 10 hr.	VESPUCCI Atmospheric Probe Quadrupole Mass Spectrometer, Tinsdale Laser Spectrometer
1.2. What is the morphology and composition of Enceladus' surface, especially in the moon's south polar region?	1.2.1. Visual and thermal mapping of the surface in the IR. 1.2.2. Topography mapping.	1.2.1. Visual and thermal mapping of the surface in the IR. 1.2.2. Topography mapping.	Pressure and temperature sampling every 2 s. Altitude resolution: 0.2 to 0.06 km at 100 m/s. Time resolution: 2 s. Pressure ranges of three ranges 0.5, 4, and 28 bar full scale, will be read to 10 mPa resolution, giving at least count values of 0.5, 4, and 20 mPa, respectively. The accelerometer shall have 4 ranges in the probe's axial direction with a dynamic range from 3 mg ~ 600 g. The measurement resolution of the axial accelerometer in the four ranges is nominally 3 mg, 0.1 mg, 3 mg and 0.1 g. The net flux radiometer shall have 6 bandwidths ranging from 0.3 ~ 500 μm and one full-band bandwidth. The nephelometer shall probe every km. The lightning radio emission detector shall have a resolution of 10 s, a time domain of 1 ~ 100 kHz and a frequency domain of 3, 15, and 100 kHz.	Data retrieval from 1 orbit to 10 hr.	VESPUCCI Atmospheric Probe Atmospheric pressure and temperature sensors, Accelerometer, net flux Radiometer, Nephelometer, lightning and radio emission detector

SEAFARER: A mission to study Habitability in the Saturnian System

Scientific Goals	Scientific Question	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
2. Understand the nature and diversity of potential habitats in the Saturnian system.	2.1. What is the origin and evolution of Saturn's oceanic/moored zones (Mimas, Enceladus, Rhea, Dione, Tethys)?	2.1.1. Remote sensing of infrared detection of H ₂ O between 1 ~ 5 μm in any surface to find the D/H ratio of Enceladus, Mimas, Elys, Dione and Tethys from the surface (desorption feature at 4.1 μm) is representative for deuterium in the ice and 2 μm absorption band of H ₂ O). 2.1.2. Remote sensing of the Enceladus plume.	The wavelength coverage shall be 1 μm, with a higher resolution than VIMS, and a minimum resolution of 0.01 μm.	Perform > 5 flybys of the Saturnian moons (Mimas, Rhea, Dione, Tethys) at an altitude of < 75 km. This needs to be updated!	SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer
2.2. What is the morphology and composition of Enceladus' surface, namely in the moon's south polar region (Tiger Stripes)?	2.2.1. Visual and infrared (thermal) mapping of the South Polar Region of Enceladus. 2.2.2. Topography mapping.	2.2.1. Visual and infrared (thermal) mapping of the South Polar Region of Enceladus. 2.2.2. Topography mapping.	Image and analyze spectrally the ice surface, with a resolution of 100m/pixel. This needs to be updated!	How many flybys would you need?	SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer, Imaging System, Radar Altimetry
2.3. What is Enceladus' plume's activity variability (location, composition, time, interaction with magnetosphere)?	2.3.1. Thermal mapping (location and intensity) in the South Polar Region. 2.3.2. Magnetic field of Enceladus during flyby of the moon.	2.3.1. Thermal mapping (location and intensity) in the South Polar Region. 2.3.2. Magnetic field of Enceladus during flyby of the moon.	Image and spectral analysis at least 100 m/pixel for the imager and spectrometer. No need magnetic measurement requirements.	Flies	SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer, Magnetometer, Sub-millimeter wave Instrument, Imaging System.
2.4. What is the current state of water-rock interactions on Enceladus and subsurface ocean longevity and composition?	2.4.1. Sample the subs, origins and volatiles from the plumes of Enceladus.	2.4.1. Sample the subs, origins and volatiles from the plumes of Enceladus.	Molecular weight distribution of organic matter from IR (6 CH ₄) to > 1000 Da in plume vapor and ice particles. No need spectrometer here!	>9 Enceladus flybys at an altitude < 75 km to go to the plume down part. S/C velocity shall be 3 ~ 5 km/s and 5 km/s.	SEAFARER Orbiter High Resolution Mass Spectrometer.
2.5. What is the nature of the potential subsurface ocean on Mimas?	2.5.1. Surface image of Mimas. 2.5.2. Spectral image for detection of water vapor signatures. 2.5.3. Thermophysical properties (thermal).	2.5.1. Surface image of Mimas. 2.5.2. Spectral image for detection of water vapor signatures. 2.5.3. Thermophysical properties (thermal).	The spectrometer shall have a wavelength range of 0.5 ~ 5.5 μm, and 3 ~ 6 μm spectral resolution.	Shall perform > 9 Mimas flybys at an altitude < 750 km.	SEAFARER Orbiter Visible and Infrared Spectrometer. No need instrument?

Green Team

SEAFARER: A mission to study Habitability in the Saturnian System

Scientific Goals	Scientific Question	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
2. Understand the nature and diversity of potential habitats in the Saturnian system.	2.6. What is the nature and habitability potential of the surface and diversity of potential habitats in the Saturnian system.	2.6.1. Image and spectral analysis of the ice surface and diversity of potential habitats in the Saturnian system. 2.6.2. Infrared magnetic field.	Image shall measure at a resolution of < 10 μm. The spectrometer shall have a wavelength coverage of 0.5 ~ 5.5 μm, and 3 ~ 6 μm spectral resolution.	Flies requires for each moon	SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer.
2.7. What is the current state of interior ocean processes on Titan (cryovolcanism, tectonism, impact-driven liquid water north pole, etc.) their global distribution, geological history and the impact for organic material transport across the ice crust?	2.7.1. Surface mapping of the ice crust (cryovolcanism, tectonism, impact-driven liquid water north pole, etc.) their global distribution, geological history and the impact for organic material transport across the ice crust. 2.7.2. Surface mapping of the ice crust (cryovolcanism, tectonism, impact-driven liquid water north pole, etc.) their global distribution, geological history and the impact for organic material transport across the ice crust. 2.7.3. Surface mapping of the ice crust (cryovolcanism, tectonism, impact-driven liquid water north pole, etc.) their global distribution, geological history and the impact for organic material transport across the ice crust.	2.7.1. Surface mapping of the ice crust (cryovolcanism, tectonism, impact-driven liquid water north pole, etc.) their global distribution, geological history and the impact for organic material transport across the ice crust. 2.7.2. Surface mapping of the ice crust (cryovolcanism, tectonism, impact-driven liquid water north pole, etc.) their global distribution, geological history and the impact for organic material transport across the ice crust. 2.7.3. Surface mapping of the ice crust (cryovolcanism, tectonism, impact-driven liquid water north pole, etc.) their global distribution, geological history and the impact for organic material transport across the ice crust.	Image shall measure at a resolution of < 10 μm. The spectrometer shall have a wavelength coverage of 0.5 ~ 5.5 μm, and 3 ~ 6 μm spectral resolution.	The other must be at 2000 km of altitude in a high inclination orbit to cover the polar region. Lower altitudes can be accomplished in the covered plane of the mission.	SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Off-axis microwave radiometer.

SEAFARER: A mission to study Habitability in the Saturnian System

Scientific Goals	Scientific Question	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
2. Understand the nature and diversity of potential habitats in the Saturnian system.	2.8. What is the relative surface abundance of complex molecules on Titan and Enceladus?	2.8.1. Image and spectral analysis of the ice surface and diversity of potential habitats in the Saturnian system.	Visual and Infrared Spectrometer (0.5-5.5 μm resolution, 3-6 μm spectral resolution). Image shall measure at a resolution of < 10 μm/pixel. The spectrometer shall measure at a 500m/pixel resolution, with a wavelength coverage of 0.5 ~ 5.5 μm, and 3 ~ 6 μm spectral resolution.	Flies requires for each moon	SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Magnetometer.
2.9. Are there biogenic elements present in the organic chemistry in Titan, and, if so, what are their relative abundance and on the surface of Enceladus?	2.9.1. Elemental chemistry (e.g., Fluorine, Sulfur) in Titan's atmosphere, around and in Arden Mare.	2.9.1. Elemental chemistry (e.g., Fluorine, Sulfur) in Titan's atmosphere, around and in Arden Mare.	Mass range: Mass abundance v. molecular weight from 2 500 amu of liquid from Arden Mare. Resolution: Mass resolution shall be 1 x 10 ⁻⁴ at 50 amu. Sensitivity: minimum 0.02 counts molecule ⁻¹ cm ⁻² and 10 ¹⁰ mixing ratio.	Operation requires: at 75 K at least under a surface pressure of 1.5 bar.	COLUMBUS Deuterium Gas Chromatography-Mass Spectrometer.

2.10. What is the current state of water-rock interactions on Enceladus and subsurface ocean longevity and composition?	2.10.1. Surface image of Enceladus. 2.10.2. Spectral image for detection of water vapor signatures. 2.10.3. Thermophysical properties (thermal).	2.10.1. Surface image of Enceladus. 2.10.2. Spectral image for detection of water vapor signatures. 2.10.3. Thermophysical properties (thermal).	The spectrometer shall have a wavelength range of 0.5 ~ 5.5 μm, and 3 ~ 6 μm spectral resolution.	Shall perform > 9 Mimas flybys at an altitude < 750 km.	SEAFARER Orbiter Visible and Infrared Spectrometer. No need instrument?

Green Team

Scientific Goals	Scientific Questions	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
1. Understand Saturn's formation history, composition and orbital evolution	1.1. What is Saturn's formation history, composition and implications for the present day Solar System architecture? 1.2. What is the morphology and composition of Enceladus' plumes, especially in the moon's south polar region?	1.1.1. In situ isotopic ratios of noble gas and elements (H, He, Ne, Ar, Kr, Xe, C, N, O, and S) in Saturn's atmosphere. 1.1.2. In situ mixing ratios of the species CO, CH ₄ , PH ₄ , NH ₃ in Saturn's atmosphere. 1.2.1. Visual and thermal imaging in the IR. 1.2.2. Topography mapping	Abundance at a resolution of from 1 to > 100 nm, mass resolution > 1000 M/ZM. The Tumble laser spectrometer shall have a resolving power of ~10 ⁴ A/Δλ at least. Pressure and temperature sampling every 2 s. Altitude resolution: 0.2 to 0.6 km at speeds 100 to 30 m/s. Pressure sensors of three ranges 0.5, 4, and 20 bar full scale, will be read to 10 mb resolution, giving at least count values of 0.5, 4, and 20 mb, respectively. The accelerometer shall have 4 ranges in the probe's axial direction with a dynamic range from 3 mg ~ 600 g. The measurement resolution of the axial accelerometer in the four ranges is nominally 3 mg, 0.1 mg, 3 mg and 0.1 g. The net flux radiometer shall have 6 bandwidths ranging from 0.3-500 μm and one tilted bandwidth. The nephelometer shall probe every km. The lightning radio detector resolution shall have a resolution of 10 s, a time domain of 1-100 kHz and a frequency domain of 3, 15, and 100 kHz.	Data retrieval from 1 hour to 10 hr. Data retrieval from 1 hour to 10 hr.	VESPUCCI Atmospheric Probe Quadrupole Mass Spectrometer, Tumble Laser Spectrometer VESPUCCI Atmospheric Probe Atmospheric package with pressure and temperature sensors, Accelerometer, net flux Radiometer, Nephelometer, lightning and radio emissions detector

2. Understand the nature and diversity of potential habitats in the Saturnian system.	2.1. What is the origin and evolution of Saturn's oceanized moons (Mimas, Enceladus, Rhea, Titan, Triton)?	2.1.1. Remote sensing of infrared absorption of H ₂ O between 1-5 μm in icy surfaces to find the D/H ratio of Enceladus, Mimas, Rhea, Dione and Triton from the surface (absorption features at 4.0 μm is representative for deuterium in the ice and 3 μm absorption band of H ₂ O). 2.1.2. Remote sensing of the Enceladus plume. 2.2.1. Visual and infrared (thermal) mapping of the South Polar Region of Enceladus. 2.2.2. Topography and albedo mapping. 2.3.1. Thermal mapping (location and intensity) in the South Polar Region. 2.3.2. Magnetic field of Enceladus from the magnetospheric flyby of the moon.	The wavelength coverage shall be 1.5 μm, with a higher resolution than VIMS, and a minimum resolution of 0.01 nm. Image and analyze spectrally the ice surface, with a resolution of 100 μm/pixel. This needs to be specified! The ice spectral analysis at least 10 m/pixel for the ice and spectrometer 10 m/pixel. No need magnetic measurement requirements. Molecular weight distribution of organic matter from 10 to 60 (C/N) to > 1000 Da in plasma vaporizer and ion optics. S/C velocity shall be 3-5 km/s and 5-9 km/s. The spectrometer shall have a wavelength range of 0.5-5.5 μm, and 2-6 μm spectral resolution.	Perform > 5 flybys of the Saturnian moons (Mimas, Rhea, Dione, Triton) at an altitude of < 75 km. This needs to be updated! How many flybys would you need? Flybys	SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer, Imaging System, Radio Altimetry SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer, Magnetometer, Sub-millimeter wave Instrument, Imaging System. SEAFARER Orbiter High Resolution Mass Spectrometer. SEAFARER Orbiter Visual and Infrared Spectrometer. This needs more instruments!

SEAFARER: A mission to study Habitability in the Saturnian System

Green Team

Scientific Goals	Scientific Questions	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
2. Understand the nature and diversity of potential habitats in the Saturnian system.	2.6. What is the nature and habitability potential of the mid-level potential habitats in the Saturnian system? 2.7. What is the current state of interior surface processes on Titan (topography, tectonics, impact-driven liquid water melt ponds, dry glacial distribution, geological history and implications for organic material transport across the ice crust)?	2.6.1. Image and spectral analysis of the icy surface processes, including magnetic fields. 2.7.1. Surface mapping of cryovolcanic edifices (dunes, channels, pits) and their parameters (topography, shape, morphology, etc.). 2.7.2. Surface mapping of tectonic features (faults and folds) (compressional, horst and graben (extensional) and lateral displacements (strike-slip)). 2.7.3. Surface mapping of impact craters and signs to estimate impact melt volume and quantification of morphology, the spatial distribution of impact melt lakes and surface styles (thickens, channels). 2.7.4. Spatial and temporal (short-term to long-term) thermal anomalies on the surface and near surface of Titan using the imaging (5 μm) microwave.	Imager shall measure at a resolution of < 100 μm/pixel, the vertical resolution < 10 m, the signal to noise ratio of 50:1. The IR spectrometer will be the 1-μm channel (Titan atmospheric window, the only reliable channel in the IR for cryogenic detection according to Lane et al. 2006). The spectral resolution shall be 1-2-4 nm. Passive off-axis radiometer resolution with 0.1 mV radiometer, with precision on short-term variations of < 1% and absolute accuracy of ± 8%. The radiometer shall have a 1.575 GHz positive flux-bias with a 7-10 dB resolution.	The other meter to be at 2000 km of altitude in a high inclination orbit to cover the polar region. Lower altitude can be accomplished in the extended phase of the mission.	SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Magnetometer. SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Radio Altimeter microwave radiometer.

Green Team

Scientific Goals	Scientific Questions	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
2. Understand the nature and diversity of potential habitats in the Saturnian system.	2.8. What is the relative surface abundance of complex molecules on Titan and Enceladus?	2.8.1. Elemental chemical composition of organic molecules in Titan's atmosphere, aerosols and in Enceladus Mm. 2.8.2. Inventory of reduced and oxidized organic species present in Enceladus Mm. 2.8.3. Isotopic ratio determination ¹³ C/ ¹² C, ¹⁵ N/ ¹⁴ N, on chemically abundant species on Titan: CH ₄ , CH ₃ , CH ₂ , C ₂ H ₆ , C ₂ H ₄ , C ₂ H ₂ , and 10/10 parameters from samples collected in the atmosphere and in Enceladus Mm. 2.8.4. Abundance of stable gases produced by radiolytic processes (e.g. ³ He, ³ Ne) in Enceladus Mm.	Visual and Infrared Spectrometer (0.5-5.5 μm spectral resolution), 34 μm spectral resolution) Imager shall measure at a resolution of < 100 μm/pixel. The spectrometer shall measure at a < 500 μm/pixel resolution, with a wavelength coverage of 0.5-5.5 μm, and 1-6 μm spectral resolution. Mass range: Mass abundance vs. molecular weight from 200 mass of liquid from Enceladus Mm. Resolution: Mass resolution shall be 1 x 10 ⁻⁴ at 500 amu. Sensitivity: minimum LOB count abundance 10 ⁻¹⁵ cm ⁻² and 10 ⁻¹⁰ mV mixing ratio. Operation requires: at least one surface pass of 15 hr. Gas Chromatography-Mass Spectrometer.	Flyby requirements for each moon	SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Magnetometer.

SEAFARER: A mission to study Habitability in the Saturnian System

Green Team

Scientific Goals	Scientific Question	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
1. Understand Saturn's formation and orbital evolution	1.1. What is Saturn's formation history, composition and implications for the present-day Solar System architecture?	1.1.1. <i>In situ</i> isotopic ratios of stable gas and elements (H, He, Ne, Ar, Kr, Xe, C, N, O, and S) in Saturn's atmosphere. 1.1.2. <i>In situ</i> mixing ratios of the species CO, CH ₄ , PH ₄ , NH ₃ in Saturn's atmosphere.	Abundances at a resolution of from 1 to > 100 amu, mass resolution > 1000 M/AM. The Tumble laser spectrometer shall have a resolving power of $\sim 10^4$ $\Delta\lambda/\lambda$ at least.	Data retrieved from 1 orbit to 10 hr.	VESPUCCI Atmospheric Probe Quadrupole Mass spectrometer, Tumble Laser Spectrometer
	1.2. What is the geology and composition of Encelade's surface, especially in the moon's south polar region?	1.2.1. Visual and thermal mapping in the IR. 1.2.2. Topography mapping.	Pressure and temperature mapping every 2 s. Altitude resolution: 0.2 to 0.06 km at 300 m to 20 m alt. Pressure ranges of three ranges 0.5, 4, and 20 bar full scale, will be used to 10 km resolution, giving at least count values of 0.5, 4, and 20 mb, respectively. The accelerometer shall have 4 ranges in the probe's axial direction with a dynamic range from 3 mg - 600 g. The measurement resolution of the axial accelerometers in the four ranges is nominally 3 mg, 0.1 mg, 3 mg and 0.1 g. The test flux radiometer shall have 6 bands/pans ranging from 0.3 - 500 μ m and one blind band/pans. The nephelometer shall probe every km. The lightning radio emission detector shall have a resolution of 10 s, a time domain of 1 - 100 MHz and a frequency domain of 3, 15, and 100 MHz.	Data retrieved from 1 orbit to 10 hr.	VESPUCCI Atmospheric Probe Quadrupole Mass spectrometer, Tumble Laser Spectrometer

SEAFARER: A mission to study Habitability in the Saturnian System

Green Team

Scientific Goals	Scientific Question	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
2. Understand the nature and evolution of Saturn's magnetized moons (Mimas, Encelade, Rhea, Dione, Tethys) in the Saturnian system.	2.1. What is the origin and evolution of Saturn's magnetized moons (Mimas, Encelade, Rhea, Dione, Tethys) in the Saturnian system.	2.1.1. Remote sensing of infrared absorption of H ₂ O between 1 - 5 μ m by surface. To find the D/H ratio of Encelade, Mimas, Rhea, Dione and Tethys from the surface (absorption feature at 4.0 μ m is representative for deuterium in the ice and 2 μ m absorption band of H ₂ O). 2.1.2. Remote sensing of the Encelade plume.	The wavelength coverage shall be 1.5 μ m, with a higher resolution than VIMS, and a minimum resolution of 0.01 μ m.	Perform > 5 flybys of the Saturnian moons (Mimas, Rhea, Dione, Tethys) at an altitude of < 75 km. This <i>needs to be updated!</i>	SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer
	2.2. What is the geology and composition of Encelade's surface, mainly in the moon's south polar region (Tiger Stripes)?	2.2.1. Visual and infrared (thermal) mapping of the South Polar Region of Encelade. 2.2.2. Topography and albedo mapping.	Image and analyze spectrally the ice surface, with a resolution of 100m/pixel. This <i>needs to be updated!</i>	<i>How many flybys would you need?</i>	SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer, Imaging System, Radar Altimetry
	2.3. What is Encelade's plume's activity variability (composition, time, interaction with magnetosphere)?	2.3.1. Thermal mapping (location and intensity) in the South Polar Region. 2.3.2. Magnetic field of Encelade during flyby of the moon.	Image and spectral analysis at least 10 m/pixel for the image and spectrometer 200 m/pixel. We need magnetic measurement requirements.	<i>Flybys</i>	SEAFARER Orbiter Visible-Infrared Hyperspectral Imaging Spectrometer, Magnetometer, Sub-millimeter wave Instrument, Imaging System
	2.4. What is the current state of water-rock interactions on Encelade and subsurface ocean longevity and composition?	2.4.1. Sample the salts, organic and volatile from the plume of Encelade. 2.4.2. Axiol moon.	Molecular weight distribution of organic matter from 10 to 600 Da (C_{10} to C_{60}) in a plume vapor and ice particles. <i>We need spectrometer here!</i>	> 9 Encelade flybys at an altitude < 75 km to get to the plume dense part. S/C velocity shall be 3 - 5 km/s and 5 - 9 km/s.	SEAFARER Orbiter High Resolution Mass Spectrometer
	2.5. What is the nature of the potential subsurface ocean on Mimas?	2.5.1. Surface image of Mimas. 2.5.2. Spectral image for detection of hydrocarbon signatures. 2.5.3. Thermophysical properties (thermal).	The probe spectrometer shall have a wavelength coverage of 0.5 - 5.5 μ m and 6 m spectral resolution.	Shall perform > 9 Mimas flybys at an altitude < 750 km.	SEAFARER Orbiter Visible and Infrared Spectrometer. <i>200 km more instrument</i>

SEAFARER: A mission to study Habitability in the Saturnian System

Green Team

Scientific Goals	Scientific Question	Scientific Measurements	Measurement Requirements	Mission Requirements	Instrument
3. Understand the nature and diversity in the potential habitats in the Saturnian system.	3.1. What is the nature and habitability potential of the radiation zones Dione, Tethys, Rhea?	3.1.1. Image and spectral analysis of the icy surface. 3.1.2. Surface composition and thermal properties. 3.1.3. Infrared signature field.	Image shall measure at a resolution of 10 m/pixel. The spectrometer shall measure at a < 500m/pixel resolution, with a wavelength coverage of 0.5 - 5.5 μ m, and 5.6 m spectral resolution.	<i>Flyby requirements for each moon</i>	SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Magnetometer
	3.2. What is the thermal structure and mixing rates of water in the radiation zones Dione, Tethys, Rhea?	3.2.1. Thermal structure in the thermal structure and mixing rates of water in the radiation zones Dione, Tethys, Rhea.	The thermal structure shall be measured with an accuracy of 1.5 s.	The orbit must be at 200 km of altitude, high inclination orbit to cover the pole region. Low alt. flybys can be accomplished in the extended phase of the mission.	SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Magnetometer
	3.3. What is the geology and composition of Encelade's surface, mainly in the moon's south polar region (Tiger Stripes)?	3.3.1. Visual and infrared (thermal) mapping of the South Polar Region of Encelade. 3.3.2. Topography and albedo mapping.	Image shall measure at a resolution of 10 m/pixel. The spectrometer shall measure at a < 500m/pixel resolution, with a wavelength coverage of 0.5 - 5.5 μ m, and 5.6 m spectral resolution.		SEAFARER Orbiter Imaging System, Visual and Infrared Spectrometer, Magnetometer

Science Questions

15

Science objectives	Science questions
SO1: How and where did Saturn form?	<ul style="list-style-type: none">● Q1.1: What is Saturn's formation history, composition and implications for the present-day Solar System architecture?● Q1.2: What are the physical, dynamical and radiative conditions of the upper atmosphere of Saturn in the pressure range between <1 bar and 10 bar?

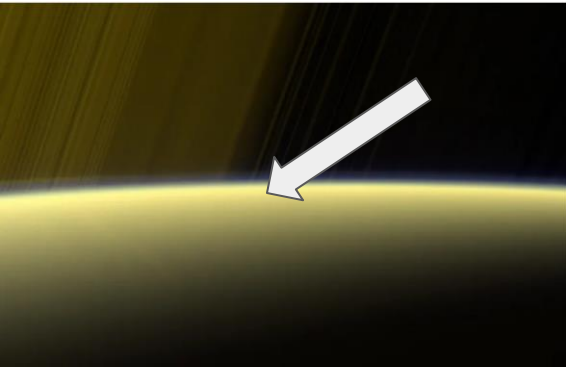

Green Team – Mission SEAFARER

Q1.1: What is Saturn's formation history, composition and implications for the present-day Solar System architecture?

16

- Measure in situ isotopic ratios of noble gases and elements (H, He, Ne, Ar, Kr, Xe, C, N, O, and S)
- Quadrupole mass spectrometer
 - Mass range [1,150] amu
 - Resolution $>1000 M/\Delta M$
- Measure in situ mixing ratios of CO, C₂H₆, PH₃, NH₃
- Tunable Laser Spectrometer
 - Resolution $10^5 \lambda/\Delta\lambda$
- Measurements $<1\text{-}10$ bar

→ Atmospheric probe VESPUCCI

Science Questions

17

Science objectives	Science questions
SO2: What is the nature and diversity of potential habitats in the Saturnian system ?	<ul style="list-style-type: none">• Q2.2: What is the geomorphology and composition of Enceladus' surface, namely in the moon's south polar region (Tiger Stripes)?• Q2.3: What is Enceladus' plume activity variability (location, composition, time, interaction with magnetosphere)?• Q2.5: What is the nature of the potential subsurface ocean on Mimas?• Q2.7: What is the current state of interior-surface processes on Titan, their global distribution, geological history and implications for organic material transport across the icy crust?• Q2.9: Are there biogenic elements present in the organic chemistry in Titan, and, if so, what are their abundances?

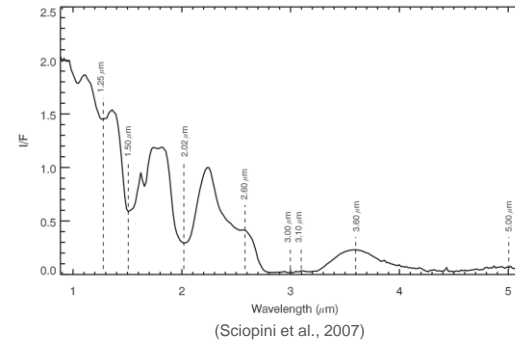

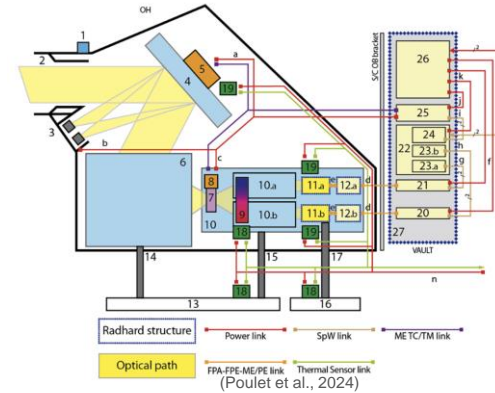

Q2.1: What is the geomorphology and composition of Enceladus' surface namely in the moon's south polar region?

18

- Measure spectra of the south polar terrain to extract composition and physical properties of water ice
 - resolve smallest feature → spatial resolution of 100 m/pixel
- Visual and Infrared Spectrometer
 - range 0.5-5 μ m (two multi-band spectrometers: VIS & IR)
 - spectral resolution ~10nm
- Minimum of 10 flybys to cover the whole south polar area at an altitude of 100km

→ Orbiter

Green Team – Mission SEAFARER

Interplanetary Cruise

- Proved by CDF studies
- Launch with an ARIANE 64 EVO
- Solar electric propulsion (SEP)
- Launch window of ~21 days, with limited to no variations of V_{∞} , and launch opportunities every 12.5 months

SEP: Solar Electric Propulsion
EGA: Earth Gravity Assist
CDF: Concurrent Design Facility

Trajectory

- Earth orbit
- Asteroid Belt
- Ballistic Arc
- Solar Electric Propulsion Arc

→ V_{∞} at departure

→ V_{∞} at arrival

● Earth Encounter (300 km altitude)

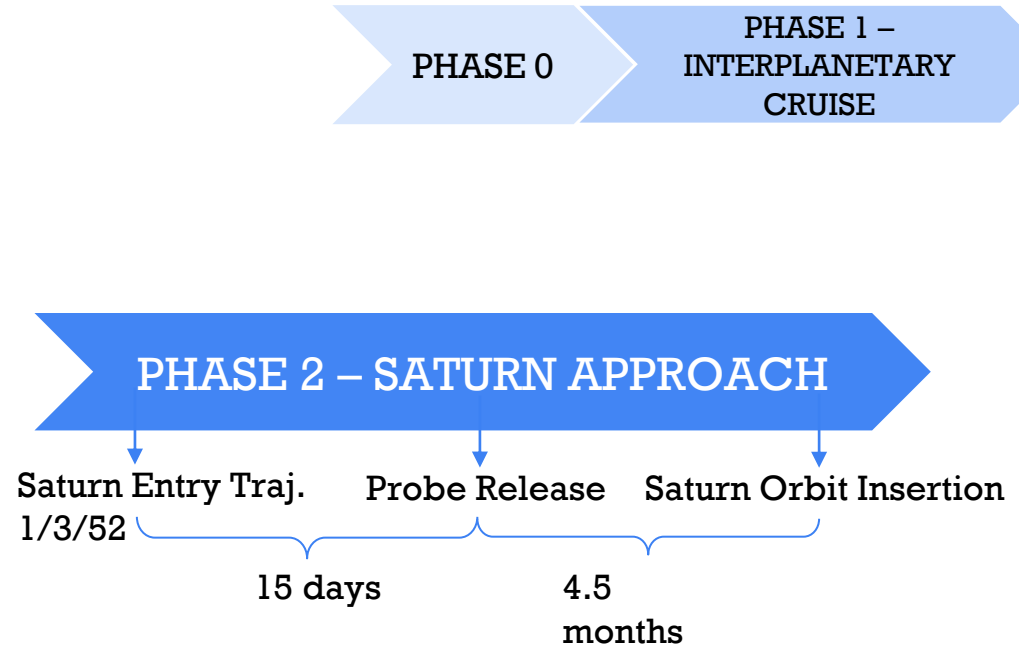

● SEP Maneuver

Manoeuvre	Duration	Max. Sun distance
SEP ARC 1	49 days	<1.2 AU
SEP ARC 2	180 days	<2.2 AU
SEP ARC 3	49 days	<1.2 AU

Phase 2 – Saturn Approach

Action Sequence

- Jettison of the SEP → Switch to RTGs
- Entry Trajectory to Saturn with a 55° inclination
- Probe Release 5 months before perikrone
- SOI in a safe orbit with perikrone at 2000 km altitude from 1-bar level

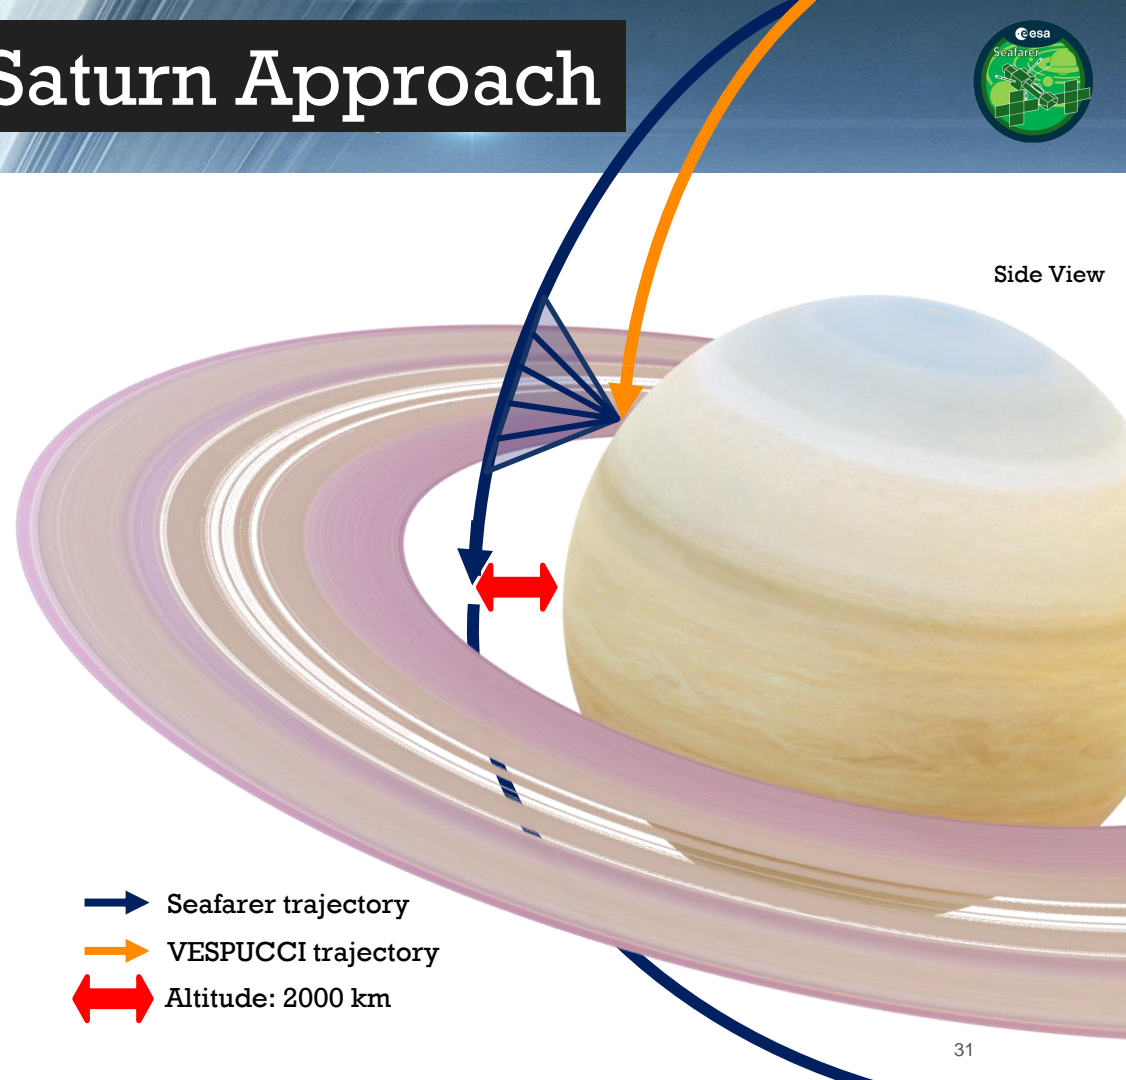

Phase 2 – Saturn Approach

Key Aspects

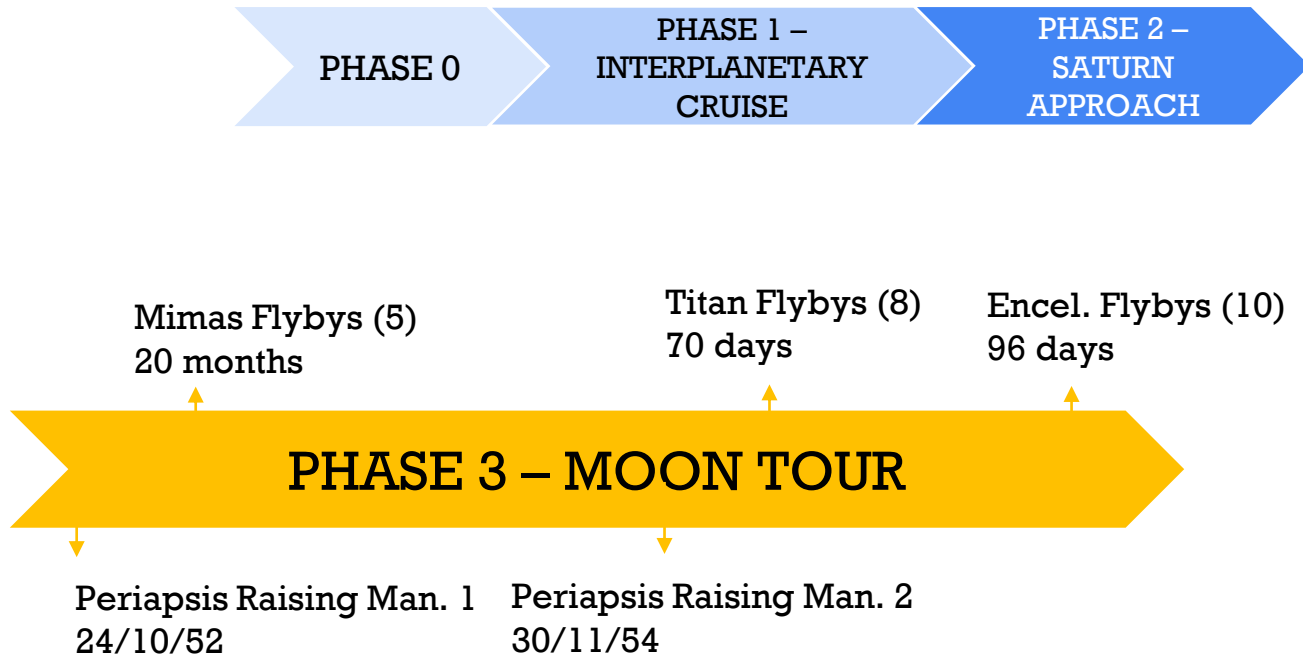

- The SOI shall also:
 - 1) reduce the velocity of the spacecraft
 - 2) increase the altitude
- wait for the entry of the probe into the atmosphere and maximise the communication window
- The early close approach has been proved safe by Cassini but still needs particular attention for communication overload

SOI: Saturn Orbit Insertion

Action Sequence

- PRM at the apoapsis of the first Saturn orbit to enlarge the periapsis at Mimas
- Flybys to Mimas at different altitudes
- Inject in 7:1 resonance flyby sequence of Enceladus using Titan swingbys for the second PRM

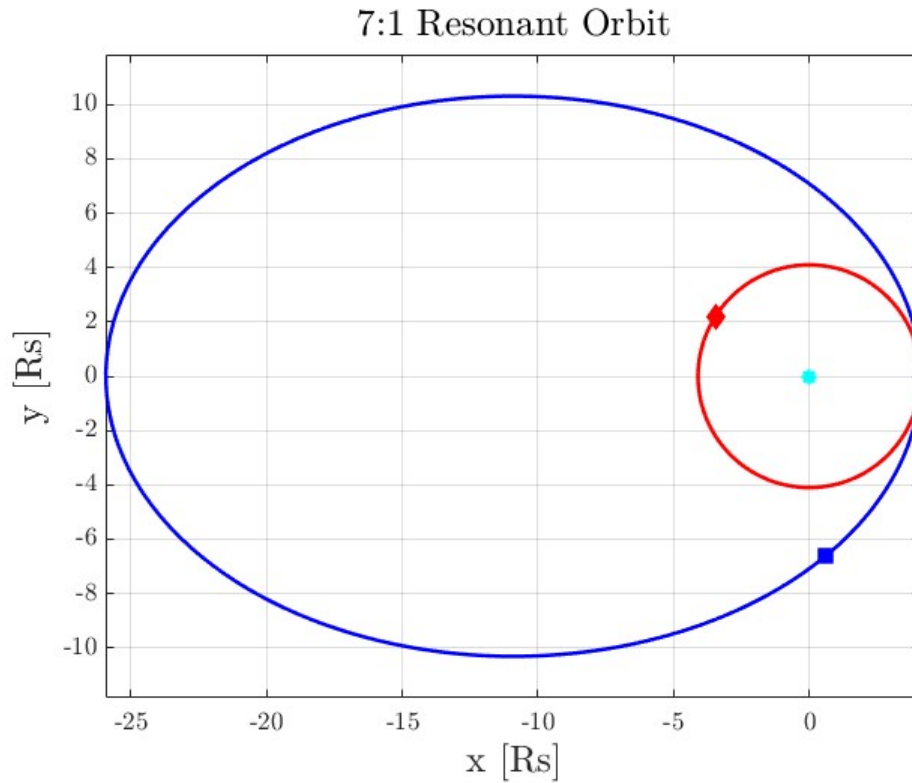

Key Aspects

- Mimas flybys require 4 months each due to the high initial V_{∞} from the cruise
- Possible visit to other medium-size moons is based on opportunity windows
- Reduction of the inclination wrt equatorial plane to $<20^{\circ}$

Top View

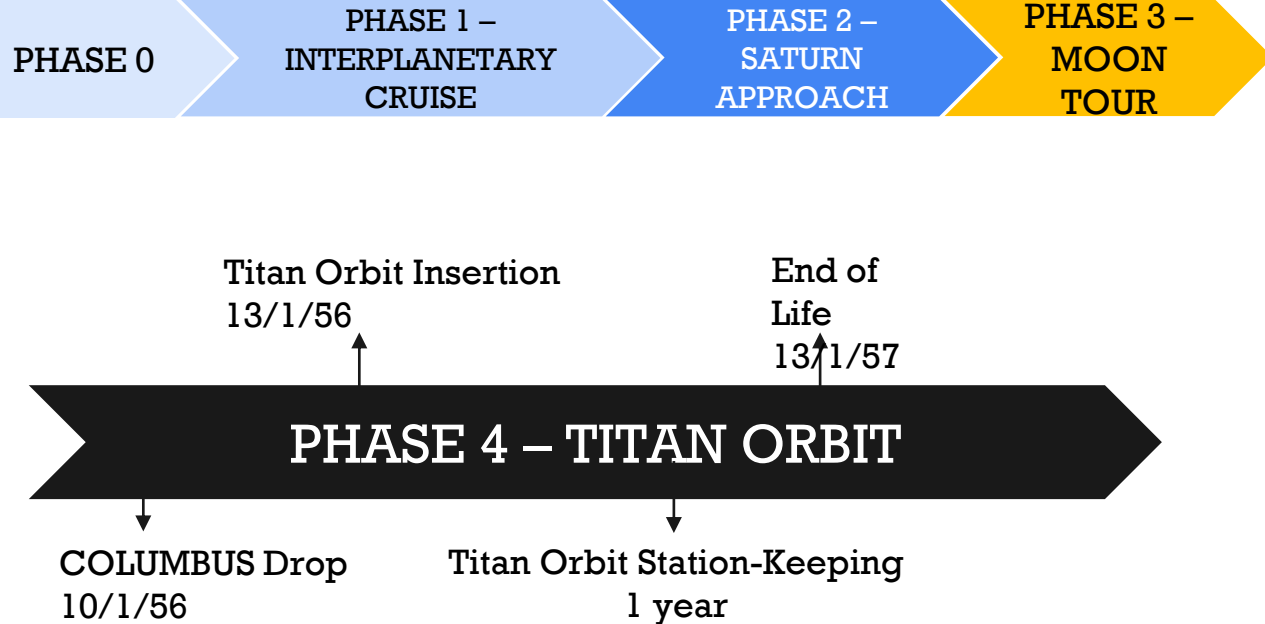

- Saturn
- Enceladus Orbit
- COOK Orbit
- Titan Transfer

Phase 4 – Orbiting Titan

Action Sequence

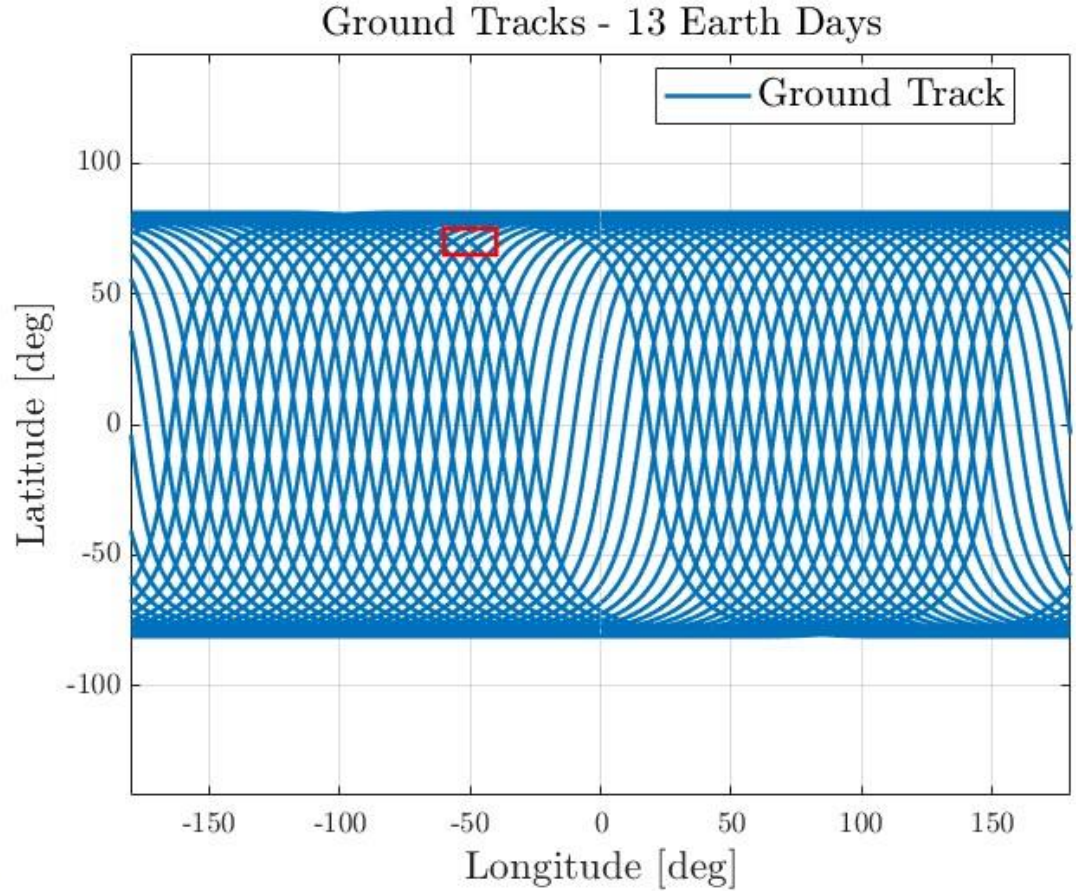

- Entry trajectory to Titan to release the lander
- TOI into a safe, circular orbit at 2500 km altitude
- One-year-long station-keeping with the possibility of mission extension
- Disposal on Titan caused by Saturn perturbations

Phase 4 – Orbiting Titan

Lander Key Aspects

- Lander drop ~3 days before orbit insertion
- Landing site constraints:
 - 1) Cassini mapped three large lakes within 70° and 78° N latitude
 - 2) DeltaV budget and mitigation of perturbations
- Final Choice: Kraken Mare (70° N, 50° E)
- The orbit provides coverage to the lander for operative life

ΔV budget and dimensioning

PHASE	ΔV [km/s] (5% margin)	Propellant Mass [kg]	Propellant Mass [kg] 10% margin
1 – Interpl. Cruise	3,11	520	572
2 – Saturn Approach	0,72	1107	1218
3 – Moons Tour	0,45	676	744
4 – Titan Orbit	0,81	986	1084
AOCS allocation	0,1	198	218
TOTAL	5,1	3489	3838

Dimensioning constraints

- ΔV for SEP cruise → Solar panel size 110m^2
- ΔV for Saturn Tour → Total bipropellant mass
→ Iteration on maximum initial
spacecraft mass: 7.5t

Propellant System	Isp [s]
Xenon propellant	4400
MMH+ N_2O_4	321

Green Team – Mission SEAFARER

Orbiter Mission Modes

52

Phase/Mode	Mode description
LEOP	Commissioning of the spacecraft, communication with Earth using X-band.
Safe mode	Spacecraft kept in safe state, pointing to Earth for comms.
Recovery/Reboot mode	Recovery from safe mode.
SEP cruise	SEP cruising using Solar arrays and SEP fuel
Cruise	Cruising following SEP
Probe Internal Checkout	Biannual check of probe and lander instruments during cruise
Standby	Instruments powered ON at low power.
Science mode	Instruments powered ON at full power, data recorded to onboard storage
Manoeuvre	Trajectory changes using chemical propulsion
Earth Comms	Communication with Earth using Ka-band (or backup X-band)
Science Comms	Communication with probe/lander using UHF and X-band respectively

Orbiter Power Budget

53

Green Team – Mission SEAFARER

Link Budget

54

Orbiter-Earth Budget		Orbiter-Payloads Budget	
Frequency (Ka-Band) [GHz]	32	Frequency (X-Band) [GHz]	8.5
Maximum range [AU]	10.5	Maximum range [km]	~ 3000
Orbiter Transmitter Power [W]	40	Lander Transmitter Power [W]	15
Data rate [kbps]	0	Data rate [kbps]	40
Final E_B/E_N [dB]	3.6	Final E_B/E_N [dB]	5.7

- **ESA DSN Network:** 35m dishes at Cebreros, New Norcia, and Malargue
- Saturn moon tour: single 4-hour DSN pass per day
- Titan orbit: expect 5h to 8h DSN pass per day → data downlink every 4 orbits.
- Min. datarate: 40 kbps (total between: 720 Mb/day and 1.15 Gb/day)

Orbiter Design

The background image is a composite. The lower half shows a high-resolution view of a planet's surface, likely Mars, with a prominent circular crater in the foreground. The upper half shows a satellite in orbit, with a large, bright, streaked light source (possibly the Sun or a distant star) in the upper left and a bright star or planet in the upper right. The text "Orbiter Design" is overlaid in green on the left side.

STR-1 : Launch with Ariane 64 EVO.

COM-1 : Shall sustain Telemetry, Science downlink, and relay links.

Structure	
Structure material	Composite, Aluminium
# articulated structures	1 HGA, 2 Solar Arrays
# deployed structures	2 solar arrays, 3 RTGs, 1 magnetometer boom, 1 radar antenna, Lander deployment mechanism, Probe deployment mechanism
Communications	
Antennas and gain	4m stiff gimbaled HGA for Ka-band, 61dBi 16cm Horn MGA X-band , 22.6 dBi 25cm UHF Antenna
Data rates	50/40 kbps to Earth (40 W transmitter power) 40 kbps relay link (lander) 1000 bps relay link (probe)

Challenges:

Stow orbiter + SAs + SEP system + probe + lander + adapters in Ariane 64 EVO fairing.

Keeping sufficient data rate between Earth and Orbiter (to manage on-board science and relay links)

- When close to Earth (8.5AU) - expect rate 50 kbps
- When at maximum distance (10.5AU) - can only sustain rate of 40 kbps.

Inspiration: Mars Reconnaissance Orbiter, PEP probes, SPRITE, TSSM, EPIG

POW-1 : Shall sustain the S/C during the SEP and nominal mission lifetime.

POW-2 : Shall provide power and charge the batteries of the probe and lander prior to release.

TC-1 : Maintain temperature of instruments between ~ 250 K and 280 K.

TC-2 : Maintain temperature of batteries between 278 K and 298 K.

SEP Power	
Solar array type and size, m ²	Ga-As, 110
Expected power generation, W/m ²	375,75 (BOL) and 77,63 (EOL)
Expected power consumption, W	7500
Science Power	
Power Source	3 GPHS-RTGs (New Horizon, Cassini)
Battery type	LiSO ₂ to stabilise RTG power
Driving power mode, W	Science ~ 500 W & Telecoms ~ 400 W
Thermal Control	
Type of thermal control	MLI, Heat Pipes and RHUs
Heat output of RTGs, K	3 x 3850

Trade-off:

Solar Arrays vs Nuclear power vs RTGs (higher TRL & less moving parts)

Challenges:

Selection of duty cycles for Power Modes

GPHS-RTG heat dissipation with fins with a fin root temperature of approx. 200°C. Astroquartz insulation.

How to manage RTG booms and heat? Especially with temperature sensitive Instruments?

AOC-2 : Shall orient orbiter to ensure at least 13 min of Orbiter-Lander communication (after handshake).

AOC-3 : Shall maintain pointing loss to less than 0.11 deg (same as Mars Reconnaissance Orbiter).

OBDAH-1: Shall handle, process, and store all Scientific data produced during 2 Orbits.

Attitude Control

Control methods	3-axis (w/ Inertial, Nadir, Solar references)
Attitude knowledge limit	Sun sensors (radial accuracy $< \pm 0.5$ deg), Star trackers (pitch/yaw accuracy within ± 18 arcsec), IMUs (bias stability within ± 0.015 arcsec/sec)
Articulation #axes	2 axes for HGA
Sensor and actuator information	4 RWs with 25 Nms angular storage, 16 4,5-N RCs thrusters for desaturation of reaction wheels

Command and Data Handling

Data storage capacity	3 Gbits (2 days worth of orbiter titan science & lander data)
-----------------------	---

Trade-off:

Current 100 m/s in delta-V budget to account for pointing requirements.

Issues:

Challenge in deriving pointing accuracy of instruments.

Pointing requirement for Earth & Science Comms (w/ Lander).

Prior to probe release, CoM expected to be unbalanced - increasing delta-V for manoeuvres and AOCS pointing.

Heritage/Inspiration: MRO, Enceladus Orbiter, TSSM

Launcher - Ariane 6.4 Evo

Lander

Polar Stereographic projection
Scale: 1:10,000,000
0° 10° 20° 30° 40° 50° 60° N
10° E 20° E 30° E 40° E 50° E 60° E

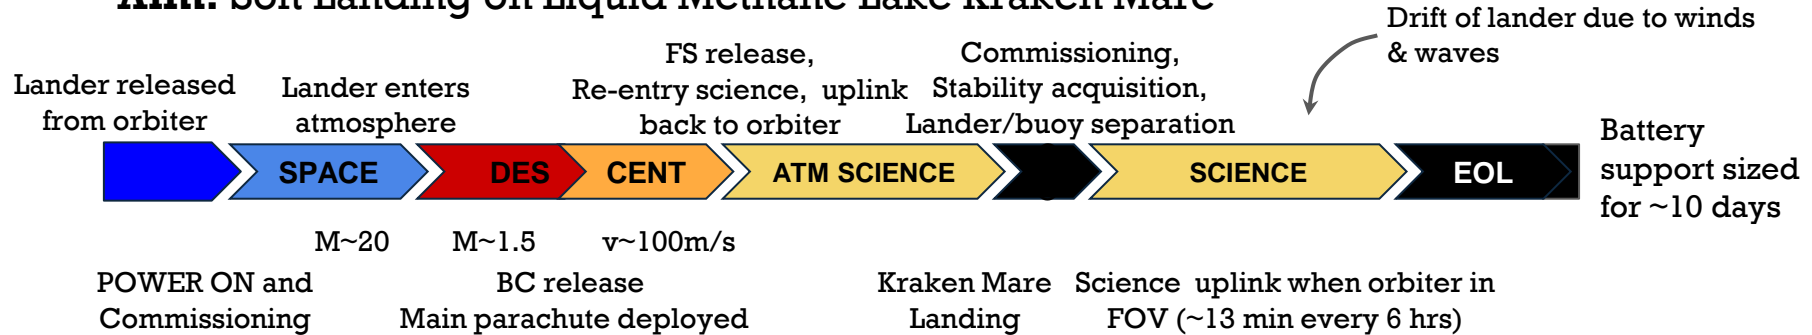

The Cassini RADAR images in this map were obtained in multiple operating modes with resolutions of 0.3–1.5 km, 2–10 km, and 60–200 km. False coloring is used to distinguish bodies of liquid hydrocarbon (blue-black) from dry land (brown) and does not represent the visual appearance of Titan's surface.

Mission Timeline

66

Aim: Soft Landing on Liquid Methane Lake Kraken Mare

Key Features:

- Huygens-like descent w/ drogues and 8.3 m main parachute
- Data uplink during descent following BC removal
- Once landed on Kraken Mare → Lander separates
 - “Warm” top buoy: batteries, heaters, and atmospheric instruments
 - “Cold” bottom buoy: GCMS and sonar

Comms:

- X-band Transceiver
- Helical, omni-directional antenna on lander

Lander Design

67

STR-1: Shall survive Titan atmospheric re-entry (~18gs, 14,000K) & perform a soft landing on the Kraken Mare.

STR-2 : shall **stay upright** (waves, wind, drift, landing)

TH-1: Shall resist a Titan's atmospheric (91 K) and liquid temperature (91 K), and hydrostatic pressure.

SCI-1: Shall drop sample sensor and **collect the data** from it.

Part	Spec
Mass (kg)	297
Power (W)	Max 150
Thermal (K)	14000 Heat shield
Data Rate (kbps)	40
Base Diameter (m)	1.3

Trade-off:

- 5 m maximum deployment depth
- Can not measure the entire temperature profile

Challenges:

- **Thermal management:** warm batteries & instruments vs. cold outside.
- Impact of hot lander on environment being measured.
- **Hoist mechanism** for lowering the bottom “cold” buoy.
- Cryogenic temperatures → compliance of material.

Probe

Probe System Architecture

Probe Design

72

STR-1: The probe shall reach at a depth where the pressure is of at least **10 bar**.

POW-1: Probes power system shall be able to **provide 140 W** throughout the measurement phase.

OBDH-1: The probe OBDH shall be able to **handle 32 bps**.

TH-1 : The probe shall survive a **maximum temperature of 2000 K**.

TH-2 : The internal temperature shall not exceed the instrumental **temperature range of 253.15 K - 323.15 K**.

Part	Spec
Mass (kg)	270
Power (W)	Max 140
Thermal (k)	14,000
Parachute Diameter (m)	2.5
Base Diameter (m)	1.3

Challenge:

Thermal shielding as probe descends through Saturn's cloud

Communication window with S/C

Heritage/Inspiration: PEP probes & Galileo

Components:

Descent: 2 parachutes with main parachute $D=2.5$ m

Communication: UHF transceiver to orbiter, 0.5 m patch antenna on back cover and helix antenna during descent.

Thermal: expected at entry: 2000 K

Probe - Instruments

73

Payload Instrument	Instrument Requirement
Mass spectrometer	Shall have a resolution of >1000 $M/\Delta M$ Shall measure in a mass range between 1-150 amu
Tunable Laser Spectrometer (TLS)	Shall have a resolving power of $\sim 10^5 \lambda/\Delta\lambda$
ASI Unit (Temp. / Press. / Accel.)	Shall measure every 4&2, 6 seconds
Net Flux Radiometer	Shall measure every 4&2, 6 seconds
Nephelometer	Shall measure every 5 mins
Lightning and Radio Emissions Detector	Shall measure every 256 s

Green Team – Mission SEAFARER

Planetary Protection

Risk of carrying bacteria from Earth or pollute Titan?

- Given the fact that Titan is too cold and that there is no liquid water for life as we know it to evolve, the **risk of contamination is practically non-existing**. The harsh environment is expected to kill microorganisms that may have hitchhiked from Earth on board the clean space probe.

Risk of carrying bacteria from Earth or pollute Enceladus?

- Care has been taken to ensure that the orbiter does not crash into a body which has a significant chance for hosting life, such as Enceladus.
- Enceladus' plumes will be studied with **fly-bys** (no lander or probe).

Risk of carrying bacteria from Earth or pollute Saturn?

- Scientists have decided to impact the probe into the atmosphere of Saturn to ensure biological contamination will not occur. Although the possibility that Saturn might host life is unlikely, the spacecraft will not risk even that unlikely scenario.
- The **probe will disintegrate** and be scattered into the giant gaseous planet's atmosphere, preventing possible contamination from Earth

Cleanroom Design for Deep Space Satellites

Deep Space satellites demand greater consideration for microbe counts. **The requirement is ISO 3 cleanroom (Fed. Class 1) or better:** partitioned cleanrooms with air lock entry systems, HIPA filters, special protective clothing for people assure that entry and exit does not introduce contamination.

Tools, raw materials and packaging must be wiped down and enter through integrated passthrough chambers. Items are sterilized with IPA wipedowns, autoclaves or by gamma sterilization.

Reason

It's possible that rogue earth microbes (fungus, bacteria, viruses) could colonize or even cannibalize other life on distant planets and spacecraft.

CONTAMINANT: any unwanted molecular or particulate matter (including microbiological matter) on the surface or in the environment of interest, that can affect or degrade the relevant performance or life time.

CONTAMINATION: An unwanted material or substance that causes degradation in the desired function of an instrument or flight hardware.

Table 1 — ISO Classes of air cleanliness by particle concentration

ISO Class number (N)	Maximum allowable concentrations (particles/m ³) for particles equal to and greater than the considered sizes, shown below ^a					
	0,1 µm	0,2 µm	0,3 µm	0,5 µm	1 µm	5 µm
1	10 ^b	d	d	d	d	e
2	100	24 ^b	10 ^b	d	d	e
3	1 000	237	102	35 ^b	d	e
4	10 000	2 370	1 020	352	83 ^b	e
5	100 000	23 700	10 200	3 520	832	d, e, f
6	1 000 000	237 000	102 000	35 200	8 320	293
7	c	c	c	352 000	83 200	2 930
8	c	c	c	3 520 000	832 000	29 300
9g	c	c	c	35 200 000	8 320 000	293 000

^a All concentrations in the table are cumulative, e.g. for ISO Class 5, the 10 200 particles shown at 0,3 µm include all particles equal to and greater than this size.

^b These concentrations will lead to large air sample volumes for classification. Sequential sampling procedure may be applied; see Annex D.

^c Concentration limits are not applicable in this region of the table due to very high particle concentration.

^d Sampling and statistical limitations for particles in low concentrations make classification inappropriate.

^e Sample collection limitations for both particles in low concentrations and sizes greater than 1 µm make classification at this particle size inappropriate, due to potential particle losses in the sampling system.

^f In order to specify this particle size in association with ISO Class 5, the macroparticle descriptor M may be adapted and used in conjunction with at least one other particle size. (See C.7)

^g This class is only applicable for the in-operation state.

Preventing Extra-Terrestrial Contamination

A satellite cleanroom prevents earth-borne contamination from invading extraterrestrial environments, so the project must undergo a review to establish a threshold of allowed microbial counts based on a risk assessment. See: [COSPAR Planetary Protection Policy](#)

Committee on Space Research

Green Team – Project HORUS

Category II missions comprise all types of missions to those target bodies where there is significant interest relative to the process of chemical evolution and the origin of life, but where there is only a remote 1 chance that contamination carried by a spacecraft could compromise future investigations. The requirements are for simple documentation only.

Preparation of a short planetary protection plan is required for these flight projects primarily to outline intended or potential impact targets, brief Pre- and Post-launch analyses detailing impact strategies, and a Post-encounter and End-of-Mission Report which will provide the location of impact if such an event occurs.

Category II Flyby, Orbiter, Lander: Venus; Moon; Comets; Carbonaceous Chondrite Asteroids; Jupiter; Saturn; Uranus; Neptune; Ganymede*; Callisto; **Titan***; Triton*; Pluto/Charon*; Ceres; Kuiper-belt objects > ½ the size of Pluto*; Kuiper-belt objects < ½ the size of Pluto; others TBD
